

Lab 10. CRUD Application with MySQL

Overview

In this lab, you will implement a single-page application that uses a MySQL database.

Requirements

1. Download travel.csv from Canvas and create a corresponding MySQL table to store the travel destination information. Add a primary key to the table.
2. Create a web application using Vite.
3. Implement CRUD (Create, Read, Update, Delete) operations on the travel destination table.
 - Display the travel destination records in a table on the web page, and use pagination to display the records across multiple pages.
 - Allow users to perform insert, update, and delete operations through the web interface.
 - Ensure the user interface is reasonably well designed and easy to use.
4. Test the application to ensure that all functions work correctly.

Submission

- Deploy the application to the Mercury server
- Submit the Mercury URL on Canvas
- Demonstrate the application to the tutor
